

Year 6 maths – Week Beginning 27.04.20

Theme	Pie Charts lesson 1 (of 3) Interpreting Pie Charts in Numbers and Fractions	Pie Charts lesson 2 (of 3) Interpreting Pie Charts with Percentages and amounts	Pie Charts lesson 3 (of 3) Adding fractions with the same denominator.	Line Graphs Lesson 1 (of 2) Drawing Line Graphs	Line Graphs Lesson 2 (of 2) Interpreting Data from Line Graphs												
Factual fluency (to aid fluency)	Interpret pie charts on this website.	Recap your knowledge on percentage here .	Work out missing angles on this website.	Create line graphs on this website.	Interpret line graphs on this website.												
Problem/ activity of the day	<p>(Lesson 1 resources below) MAKING LINKS: We learnt about line graphs in Year 5, which can represent data (usually collected in a table). Pie charts are another way to represent the data.</p> <p>THINK: (support below) Can you help me with this problem? A pie chart shows children's favourite pizza toppings.</p> <p>What fraction chose cheese?</p>  <p>SEE: (model below) Watch lesson video here.</p> <p>DO: Use what you have learnt today to solve: How many children chose mushrooms? How many children chose ham and pepperoni? Watch lesson part 2 here.</p> <p>Then, solve the other problems below.</p>	<p>(Lesson 2 resources below) MAKING LINKS: Yesterday we learnt how to interpret pie charts.</p> <p>THINK: (support below) Can you help me with this problem? What percentage of the smoothie is lime juice? If the total amount of juice is 250ml, how much pineapple is there?</p>  <p>SEE: (model below) SEE video clip: Watch lesson video here.</p> <p>DO: Use what you have learnt today to use a different strategy to work out how much orange and lime there is.</p> <p>Then, solve the other problems below.</p>	<p>(Lesson 3 resources below) MAKING LINKS: Yesterday we learnt how to interpret pie charts using percentages.</p> <p>THINK: (support below) Can you help me with this problem? If the amount spent on food is £65, how much is spent on entertainment? If the amount spent on shopping is £150, how much is spent on hotels?</p>  <p>SEE: (model below) SEE video clip: Watch lesson video here.</p> <p>DO: Use what you have learnt today to use a different strategy to work out: How much is spent on transport?</p> <p>Then, solve the other problems below.</p>	<p>(Lesson 4 resources below) MAKING LINKS: This week, we learnt how to interpret discrete data (that can be counted) from pie charts. Today we will interpret continuous data (that changes over time) from line graphs, which we learnt about in Year 5,</p> <p>THINK: (support below) My friend's app tells him how far and how long he has been walking or running</p> <table border="1" style="margin: 10px auto;"> <tr> <td>Time in mins</td> <td>10</td> <td>20</td> <td>30</td> <td>40</td> <td>50</td> </tr> <tr> <td>Distance travelled in km</td> <td>1</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> </tr> </table> <p>How could these readings be displayed in a line graph?</p> <p>SEE: (model below) Watch lesson video here</p> <p>DO: Use your line graph to solve the problems below:</p>	Time in mins	10	20	30	40	50	Distance travelled in km	1	2	3	4	5	<p>(Lesson 5 resources below) MAKING LINKS: We learnt about interpreting line graphs yesterday and about converting units of length (centimetres to inches) and mass (kilograms to pounds) in Year 5. This lesson combines both skills.</p> <p>THINK: (support below) One friend uses 1 mile \approx 1.6 km to convert between miles and kilometres Another friend uses this graph to convert</p>  <p>Which method is most accurate?</p> <p>SEE: (model below) Watch lesson video here</p> <p>DO: Use both methods to complete the table below. Decide on the most accurate answer</p>
	Time in mins	10	20	30	40	50											
Distance travelled in km	1	2	3	4	5												
Time to check	Day 1 resources and answers (below)	Day 2 resources and answers (below)	Day 3 resources and answers (below)	Day 4 resources and answers (below)	Day 5 resources and answers (below)												

DAY 1 RESOURCES:
THINK:

Looking at the pie chart below, can you work out: what fraction of people chose cheese? (We know the number that chose cheese, now we need to work out the fraction).

See [support video](#) for additional help.

SEE:

I can see that 35 people chose cheese, but now I need to convert that to a fraction. $\frac{1}{3}$ chose Ham and Pepperoni, and I can see from the right angle that $\frac{1}{4}$ chose mushroom.

So now, all I need to do is work out what fraction is left! I will convert $\frac{1}{3}$ and $\frac{1}{4}$ so they have the same denominators: $\frac{4}{12}$ and $\frac{3}{12}$. Added together, this makes $\frac{7}{12}$.

I know 1 whole is $\frac{12}{12}$ so I can take $\frac{7}{12}$ away from $\frac{12}{12}$ to get $\frac{5}{12}$. This means that 35 people, is the same as $\frac{5}{12}$.

Now solve:

How many children chose mushrooms?
How many children chose ham and pepperoni?

DO:
Favourite Colours

The table below shows the favourite colours of 50 children across the Q1E trust. Use the information on the pie chart to work out the missing information in the table.

Colour	Number	Fraction
Red		$\frac{1}{5}$
Yellow	20	
Green		$\frac{1}{5}$
Blue	5	
Black		

Deepening: How would the information change if the total number of people surveyed was 40? Can you explain fully and give ways to solve?

DAY 2 RESOURCES:

THINK:

Looking at the pie chart below, can you work out what percentage of the smoothie is lime juice? If the total amount of juice is 250ml, how much pineapple is there?

SEE:

FRUIT JUICE IN SMOOTHIE

What percentage of the smoothie is lime juice?

The key information we need to know here is that one whole is the same as 100%. This will help us to solve the problem.

So I know that 20% (the banana) + 32% (the orange) + 40% (the pineapple) + something (the lime) is going to equal 100%.

I added up the three percentages I knew first. $20 + 32 + 40$ was equal to 92. Then I took 92 away from 100. So I worked out that 8% was lime.

If the total amount of juice is 250ml, how much pineapple is there? For questions like this, it's useful to draw a table with what we know already. I know that 250ml is the whole bottle, which is the same as 100%.

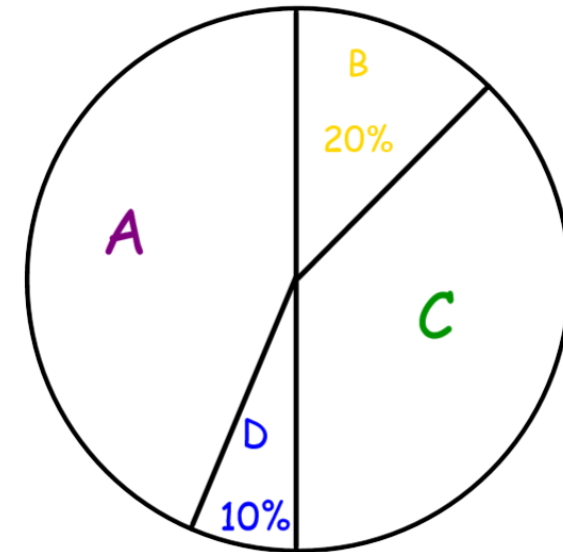

In order to work out the amount of pineapple, I'll work out the banana first. I need to think: how did I get from 100% to 20%? I worked out that $100 / 5$ is 20. If I divide 100 by 5 to get to 20, I can also divide 250 by five to work out the number of millilitres. You can use the same strategy to work out the amount of pineapple.

$$\begin{array}{l} 250 \text{ ml} = 100\% \\ 50 \text{ ml} = 20\% \\ \qquad \qquad = 40\% \end{array} \quad \left. \begin{array}{l} \\ \\ \end{array} \right) \div 5$$

DO:

Film choices in Y6

- 1.) What percentage of children chose film A?
- 2.) What percentage of children chose film C?
- 3.) If there were 50 children surveyed in total, how many children chose each film?

Deepening: Draw a bar chart to represent the same information.

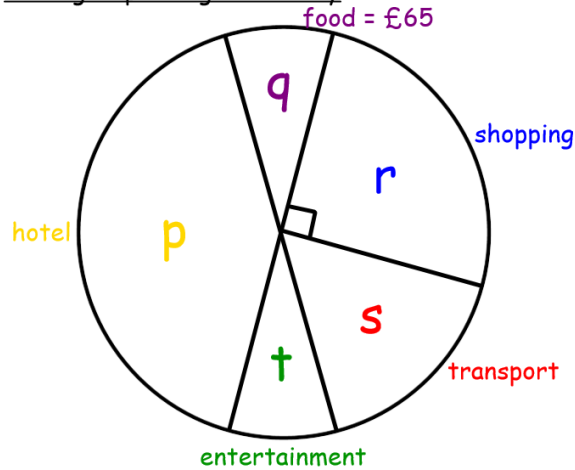

DAY 3 RESOURCES:

THINK:

If the amount spent on food is £65, how much is spent on entertainment?
If the amount spent on shopping is £150, how much is spent on hotels?

SEE:

Average Spending on Holiday

If the amount spent on food is £65, how much is spent on entertainment?

This question is easy to solve if you know one key piece of information: **Angles** that are **opposite** each other when two lines cross, (the two **angles** share the same corner) are equal (so that means they have the same measurement). With this information, we can now easily see what amount was spent on Entertainment! That's right- it's £65.

If the amount spent on shopping is £150, how much is spent on hotels?

I know that if I added up "t", entertainment with "p", hotels, it would make exactly half the circle, or 180 degrees. I can also see that the section with "shopping" has got a right angle. That means it's 90 degrees. I can add up two right angles to make a straight line! So this means that two lots of "shopping" would add up to the same amount as "hotel" and "entertainment"! I can write it as an algebraic expression like this: $t + p = r \times 2$ (or $2r$)
Now I can substitute the numbers in for the values I know. T is £65, and R is £150.
Next, I'll multiply the £150 by 2 to get 300.
Now I have everything solved except for p, "hotels". I took £65 away from £300 and worked out that p was 235 pounds.

DO:

Children's Favourite Trips

- 1.) On the above pie chart, which values are the same?
- 2.) If the total number of children is 48 and "zoo" is 4, can you work out the rest of the values?

Deepening: show more than one way of working out how much was spent on transport in the "SEE" question.

THINK:

My friend's app tells him how far and how long he has been walking or running

Time in mins	10	20	30	40	50
Distance travelled in km	1	2	3	4	5

How could these readings be displayed in a line graph?

DO:

Use your line graph to solve the following problems:

How far did my friend travel in 25 mins?

How far would my friend walk in one hour at this speed?

How long would it take my friend to travel 100km at this speed?

What else can we work out?

Think of 2 questions that are easy for you to answer

Think of 2 questions that are difficult for you to answer

Think of 2 questions that are impossible for you to answer

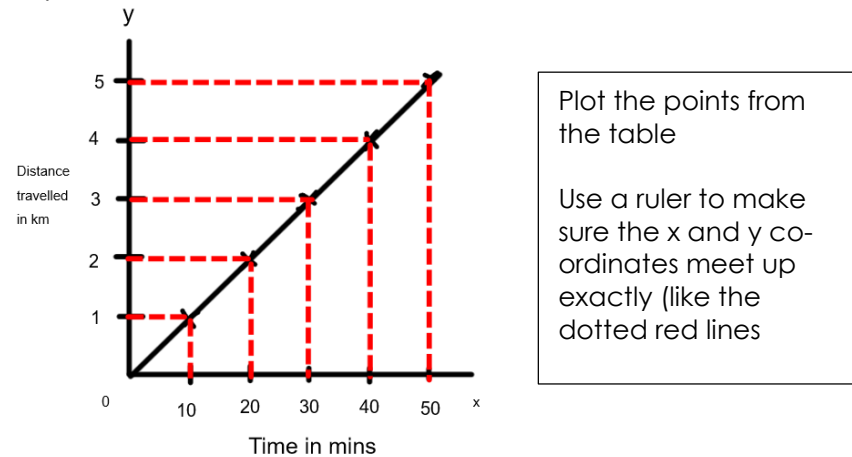

Deepening: Collect some data of your own and create a line graph

SEE: support video

Step 1:

Step 2:

Step 3:

Step 4:

DAY 5 RESOURCES:

THINK:

Using the graph to convert: use a ruler to find the point when x co-ordinates and y co-ordinates meet the line.

Using **1 mile \approx 1.6km** to convert: this method involves multiplying by 1.6 to convert miles to km and or dividing by 1.6 to convert km to miles. It is best to use long division to do divide by 1.6

SEE: [support video](#)

Using the graph to convert: use a ruler to find the point when x co-ordinates and y co-ordinates meet the line. The diagram below shows that **1 mile \approx 1.6km and 2.5 \approx 4km** (note that it is difficult to be very accurate using this method)

Using **1 mile \approx 1.6km** to convert: this method involves multiplying by 1.6 to convert miles to km and or dividing by 1.6 to convert km to miles. It is best to use long division to do divide by 1.6

Distance between	In miles	In km
Town A and Town B	1	$\xrightarrow{\times 1.6}$ 1.6
Town B and Town C	2.5	$\xrightarrow{\times 1.6}$ 4
Town A and Town C	6	$\xrightarrow{\times 1.6}$
Town C and Town D		$\xleftarrow{+1.6}$ 4
Town A and Town D		$\xleftarrow{+1.6}$ 8

$\begin{array}{r} 2.5 \\ 1.6 \overline{) 4.0000} \\ \underline{3.2} \\ 0.80 \\ \underline{0.80} \\ 0.00 \end{array}$	<p>1.6 3.2 4.8 6.4 8.0</p>
<p>(1.6×2)</p> <p>(1.6×0.5)</p>	<p>SMART Note — basic version <small>Connect to a SMART Board™ to hide</small></p>

DO:

Use both methods to complete the table. Decide on the most accurate answer.

Distance between	In miles	In km
Town A and Town B	1	1.6
Town B and Town C	2.5	
Town A and Town C	6	
Town C and Town D		4
Town A and Town D		8
Town D and Town E	6.5	
Town E and Town B		3
Town E and Town C		5

Deepening: Create a map (to scale) showing where these towns could be

ANSWERS:

Day 1:

SEE:

What fraction chose cheese? $5/12$

How many children chose mushrooms? 21

How many children chose ham and pepperoni? 28

DO:

Colour	Number	Fraction
Red	10	$1/5$
Yellow	20	$2/5$
Green	10	$1/5$
Blue	5	$1/10$
Black	5	$1/10$

Day 2:

SEE:

What percentage of the smoothie is lime juice? 8%

$$20 + 32 + 40 + \square = 100\%$$

If the total amount of juice is 250ml, how much pineapple is there? 100ml

How much orange juice is there? 80ml .

How much lime juice is there? 20ml .

$$\begin{aligned} 250 \text{ ml} &= 100\% \\ 2.5 \text{ ml} &= 1\% \\ 80 \text{ ml} &= 32\% \\ 20 \text{ ml} &= 8\% \end{aligned}$$

$\div 100$

DO:

1.) What percentage of children chose film A? 40%

2.) What percentage of children chose film C? 30%

3.) If there were 50 children surveyed in total, how many children chose each film?

Film A = 40% . 40% of 50 = 20 children

Film B = 20% . 20% of 50 = 10 children

Film C = 30% . 30% of 50 = 15 children

Film D = 10% . 10% of 50 = 5 children

ANSWERS:

Day 3:

SEE:

If the amount spent on food is £65, how much is spent on entertainment? £65

If the amount spent on shopping is £150, how much is spent on hotels? £235

How much money was spent on transport? £85

$$p + t = q + r + s$$
$$£235 + £65 = £65 + £150 + s$$

DO:

1.) On the above pie chart, which values are the same? Zoo and Art are the same, and Camping and Museum are the same.

2.) If the total number of children is 48 and "zoo" is 4, can you work out the rest of the values?

Zoo: 4

Art: 4

$48 - 4 - 4 = 40$ (so Camping + museum together are 40).

$40 \div 2 = 20$

Camping: 20

Museum: 20

Day 4:

DO:

How far did my friend travel in 25 mins?
2.5km or 2500m

How far would my friend walk in one hour at this speed? 6km (he is travelling at a speed of 6km per hour)

How long would it take my friend to travel 100km at this speed? 1000 minutes or 16 hours and 40 minutes

What else can we work out?

Answers will vary

Deepening:

Answers will vary

Day 5:

DO:

Distance between	In miles	In km
Town A and Town B	1	1.6
Town B and Town C	2.5	4
Town A and Town C	6	9.6
Town C and Town D	2.5	4
Town A and Town D	5	8
Town D and Town E	6.5	10.4
Town E and Town B	1.875	3
Town E and Town C	3.125	5

Deepening:

Answers will vary
